

RELEASE NOTES

Flowsy — V2 Update Notes

Workout Tracker overhaul, real exercise/program data, and app-wide fixes

Prepared: August 11, 2026

Covers: DB migrations v29 → v36

Build: flowsy-local.apk (local EAS build, preview profile)

1. Stability & Compliance

Database migration crash-loop fix FIXED

Previously, the app only recorded how far a database migration got once, at the very end of all 29 steps. If the app crashed mid-migration, the next launch replayed every step from the beginning — including ones that already ran. Each of the 29 (now 36) migration steps persists its own progress immediately after completing, so a crash resumes exactly where it left off.

Privacy Policy NEW

Added an in-app Privacy Policy screen (Settings → Legal) and a matching public page, required for the Play Store listing. Covers what's collected (email for sign-in, your own logged content), where it lives (on-device by default, Firebase Cloud Storage only if you use Cloud Backup), and how to request deletion.

Live URL: <https://lifeos-8f0bf.web.app/privacy-policy.html>

2. Workout Tracker — Major Overhaul

Real exercise catalog NEW

Refreshed the exercise library from wger's open database — 834 real exercises (up from 228), each with a name, category, muscle tags, equipment, and image where available. The old "Exercise Library" and "Exercise Catalog" screens were two separate, overlapping lists; they're now one screen, filtered to the 264 exercises that actually have an image so nothing shows up blank.

Muscle diagrams NEW

Every exercise now shows a front-and-back body diagram highlighting exactly which muscles it targets (primary vs. secondary), instead of the old placeholder animated icon.

"Start Workout" — real set logging NEW

The old flow just stepped through a workout with a "mark done" button and never asked for weight or reps. Starting a workout now:

- Lets you pick exercises from the library (multi-select, same picker as before)
- Logs real sets — weight, reps, a checkmark per set, "+ Add Set"
- Auto-fills the first set from what you logged last time for that exercise
- Starts a 60-second rest timer after each completed set (+30s / skip)
- Tracks running Duration / Volume / Sets totals throughout
- Lets you add more exercises mid-session

Every checked set writes a real row to your exercise history — this is also what feeds Muscle Recovery below.

Warm-up & Cool-down — now optional, not forced CHANGED

Previously every workout session automatically bookended a fixed warm-up and cool-down sequence, with only a "skip" link. That's been removed — starting a workout now goes straight to the exercises. Warm-Up Routine and Cool-Down & Stretching are now their own pickable programs (same exercises as before), for whenever you actually want them.

Suggested Programs — 15 total NEW

CATEGORY	PROGRAMS
Weight loss	Fat Loss Circuit, Cardio & Core Shred, 20-Minute Fat Burn
Muscle building	Full Body Strength, Beginner Muscle Building, Muscle Building Upper/Lower, Lean Bulk PPL, Advanced PPL, Calisthenics Foundations
General fitness	Beginner Bodyweight, Core & Mobility
Gentle / recovery	Period-Friendly Movement, Body Pain & Stiffness Relief
Standalone	Warm-Up Routine, Cool-Down & Stretching

Every program is original content built from real exercises — spans no-equipment, dumbbell-only, and full-gym options. Programs matching your onboarding health goal show a "Recommended for you" badge.

Muscle Recovery NEW

A new per-muscle-group recovery % (Fitbod-style), computed from your actual logged sets over the last 10 days — small muscles recover in ~48 hours, large compound-lift muscles in ~96 hours. Shown as an overall ring on the Workout home screen, and a full breakdown (body diagram + list, worst-first) on its own screen.

3. Food Tracker

Barcode scanner removed FIXED

It wasn't working and was removed along with its now-dead code, rather than left half-broken.

Fruits & drinks added NEW

Common fruits and everyday drinks were missing from search — added to the local food dataset.

Meal Plans — 6 total, multi-day NEW

PLAN	GOAL	DIET
Budget Weight Loss	Weight loss	Veg & Non-Veg
Muscle Building	Muscle building	Veg & Non-Veg
Balanced Maintenance	General	Veg & Non-Veg

Built from real dishes and nutrition data already in the app's Indian-food dataset. "Budget" reflects using everyday staples (dal, rice, roti) vs. richer dishes — it's not a real ₹ price, since no verified cost data exists per dish.

4. Behind the Scenes

Exercises, programs, and meal plans now live in a real data pipeline (wger → Firestore → your device), not just a bundled file — meaning new content can be added and will sync down automatically, without needing a new app build.

5. What's Not Built Yet

IDEA	STATUS
AI voice quick-add / photo food scan / chat assistant	Fully scoped (Cloud Functions + Gemini + quota system designed), not built
Web app version	Not started — react-native-web is installed but unconfigured; the app is deeply local-SQLite-first, so this is a real porting effort
Family / partner progress sharing	Proposed as a bounded alternative to public followers/feed — not built
Public followers / social feed	Not recommended as-is — conflicts with the app's "stays on your device" privacy promise; would need a real moderation/safety plan
USDA nutrition data expansion	Identified as a legitimate open-data source, not started

Shareable achievement/streak
image cards

Proposed (Strava/Duolingo-style), not started
